

DBMS TASK – 3

Seller and Inventory Management System

Task Name	Seller and Inventory Management System
Subject	Database Management System (DBMS)
Task Number	3

Description

1. Create Seller and Inventory tables.
2. Establish relationships between sellers, products, and stock.
3. Maintain seller product information.
4. Track available and unavailable products.
5. Generate inventory status reports.

Objectives

- To store seller details in a structured database.
- To maintain product and stock information accurately.
- To establish relationships between sellers, products, and inventory.
- To identify products that are available or unavailable.
- To generate useful inventory status reports for management.

Proposed Database Tables

Table	Important Fields	Purpose
Seller	Seller_ID (PK), Seller_Name, Contact, Email	Stores seller information.
Product	Product_ID (PK), Product_Name, Price, Seller_ID (FK)	Stores product details and seller relationship.
Inventory	Inventory_ID (PK), Product_ID (FK), Quantity, Status	Tracks product stock and availability.

Expected Outcome

The completed database will provide a simple and organized system for managing sellers, products, and inventory. It will help users monitor stock levels, identify available and unavailable products, and generate inventory status reports.

Conclusion

The Seller and Inventory Management System demonstrates how DBMS concepts such as tables, primary keys, foreign keys, relationships, and reports can be used to manage inventory efficiently and accurately.
