

DBMS – WEEK 4 TASK

Task Name: Order Management System

Description: Develop an Order Management System using a relational database to manage customer orders and order details efficiently. The system should store order information, support order modifications, and generate customer order history reports.

Task Objectives

1	Design Orders and Order_Details tables.
2	Manage customer product orders.
3	Store order date, quantity, and total amount.
4	Perform order insertion and modification operations.
5	Generate customer order history reports.

Expected Database Components

- **Orders Table:** Store Order_ID, Customer_ID, Order_Date, and Total_Amount.
- **Order_Details Table:** Store Order_Detail_ID, Order_ID, Product_ID, Quantity, and Unit_Price.
- **Relationships:** Establish primary key and foreign key relationships between Orders and Order_Details.
- **Operations:** Insert new orders, update existing order information, and retrieve order details.
- **Reports:** Generate customer-wise order history showing order date, products, quantities, and total amount.

Outcome

Students will create a functional DBMS-based Order Management System that maintains customer order records accurately and provides useful order history reports.

Week: 4 **Subject:** DBMS
